

### Brake Bleeder Screws

There is a unique bleeder valve being used in production on the brake calipers. The bleeder valve has an o-ring on the base and this is to improve the fill procedures on the assembly line. There is no change to the service procedures or replacement parts for the brake calipers. If you need to replace the bleeder valve you would still use part # 44048-83A, the bleeder valve used in production is not a sold part.

Production only

Service part
